
TOGETHER HORIZON - TECHNICAL DECK

Together Horizon: Command Center Architecture

1. TOGETHERMIND - OPERATOR KNOWLEDGE ASSISTANT

Architecture Choices: Built on a local semantic RAG ingestion pipeline. Custom TXT/MD/PDF strategy documents are split into 800-character overlapping chunks, vectorized via ChromaDB using 'all-MiniLM-L6-v2' local embeddings, and indexed. Q&A prompts query OpenRouter APIs mapped with two native Python tools: 'search_knowledge_base' and 'escalate_to_human_partner'. Final responses are structured dynamically using strict Pydantic verification schemas (OperatorQueryResponse) via the LLM.

What Worked: Implementing a clean, tabbed role segregation layout on the front-end (Founder Desk vs. Partner Library Panel). The formatting validator ensures human GP escalations are gracefully flagged with metadata reasons on the dashboard.

Improvements: Add semantic file parsing that handles layout structures (tables/columns) inside large PDF playbooks. What's Needed: Access to Together Fund's proprietary playbook databases, email history, and Slack archives to ingest operational knowledge.

2. SIGNAL - PORTFOLIO HEALTH TRIAGE

Architecture Choices: Leverages a relational SQLite storage schema (companies, updates, signals, briefings) to maintain history. An LLM analyzer reads weekly founder update logs and extracts structured metrics (revenue trend, blockers, hiring status, and founder sentiment bounds from -1.0 to 1.0). The urgency engine calculates a 0-10 priority score by comparing updates against the company's historical baseline, pushing critical alerts (e.g., flat revenue, founder stress) to the dashboard in real time.

What Worked: Local database integration with on-the-fly metadata web scrapers, allowing investors to onboard new acquisitions simply by pasting the company's URL, automatically extracting sector and staging information.

Improvements: Incorporate longitudinal graphing for founder sentiment and revenue trajectories on the partner workspace. What's Needed: Direct integrations with portfolio startup metrics providers (e.g., Stripe, HubSpot, Slack) to verify self-reported numbers.

3. CORRIDOR COMPASS - GLOBAL READINESS AUDITOR

Architecture Choices: Features an HTML page crawler built with BeautifulSoup and lxml to parse layout structure, text copy, and compliance headers. Coordinates three specialized LLM critics in parallel (Messaging, Pricing, Trust Signals) and passes them to a lead editor agent to resolve conflicts and output a developer-friendly fix tickets checklist.

What Worked: Localized country audits (via the new Target Country input) that dynamically customize compliance expectations (GDPR vs. SOC2) and messaging tone. Programmatic DuckDuckGo search fallback retrieves subscription details if pricing is omitted on the landing page, avoiding low-score penalties.

Improvements: Add visual screenshot analysis (multimodal LLM audit) to check spacing, font styles, and badge alignment. What's Needed: Standardized global compliance checklists vetted by regional GTM advisors to continuously update reference benchmarks.

4. CORE HANDOVER & PRODUCTION REQUIREMENTS

To elevate Together Horizon into a secure, production-ready Command Center, the firm should provide:\n1. Host databases (e.g. AWS RDS or Supabase PostgreSQL) to replace local SQLite files and allow concurrent partner connections.\n2. Strict authentication & permissions (such as Auth0 or AWS Cognito) to separate partner access from portfolio founders.\n3. Compliance-approved LLM API keys with data privacy controls, ensuring no customer metrics or strategy playbooks are used to train public LLM models.\n4. Automated background cron tasks to ingest new playbooks and pull weekly updates, removing the need for manual triggering.
